Analysis

Description of the Problem

I intend to make a fitness tracker that will track the end user's fitness, calculate a fitness goal and provide an action plan which includes a diet plan depending on their actual fitness goal. The program takes in the users' data and will use this to calculate their BMR and then a calorie deficit or a calorie surplus depending on the user's goals. The program will also show diet plans depending on their end goal and will create an action plan for them. To calculate the user's BMR I will be using the Harris-Benedict formula to do this. I will be implementing Software Design and Development and will executing my project by using Object-Oriented Programming which will carry out an array of Objects and Records which will store the data for the user's fitness goals. My main features will include a login system containing a register account page and login page which will direct the user to the home page. The homepage will contain a menu which will direct the user to a page where they can enter their data by using their username. This will display a unique ID to the user so they can view their action plan which include their goal, action steps and diet plan. The home page will also include a help section and include advice on what the user needs assisting with regards to their health. When the user is finished, they can also logout of the program if they are done.

My projects meets all of the Advanced Higher Computing requirements because it will have an easy to use user interface, it will be maintainable and also robust. It will also meet all of the Advanced Higher Computing requirements as my project integrates with a Database using MySQL for the login system. It will store all the user login details in the database and will also store the fitness data. My project will make use of a standard algorithm and I will use an insertion sort algorithm as I believe it will be the best way to organise the fitness data and then display that to the user. I have made sure that my insertion sort will sort through an array of records and specifically sort through the fitness goals to ensure I run into no errors.

Scope

The Scope of my project will include:

1. A full deep analysis on my project detailing things such as a description of my program. It will also go into detail about Advanced Higher concepts and integration, scope, boundaries and any constraints use case diagram, requirements and a fully detailed project plan.
2. A completed design including:
    - Pseudocode for my program to design the data flow and enhancements of the Advanced Higher concepts.
    - A Complete data dictionary for my tables in my database.
    - List of MySQL Queries Designs that I will be using in my program.
    - Wireframe designs for all of my User Interfaces including all inputs, validation and with annotations. All showing the intended user interface for my fitness tracker.
    - Class Diagram for Array of Objects showing Class Name, Encapsulation, Data Types, Constructor, Properties and Methods.
3. A well-designed and successfully implemented fitness tracker with a functional login system and will allow users to track their fitness goals. With all of my project code showing. I will also include Ongoing Testing during implementation showing Research and Development of any New Skills or Knowledge during my Implementation.
4. A finalised test plan with a summary of final testing including a persona, test cases, test results and requirements testing which will show all evidence of testing including screenshots of my program and screenshots of database output tables generated by the MySQL statements.
5. An evaluation report which will evaluate my program in terms of fitness for purpose. Showing how closely my program matches the functional requirements and how my results of my testing show this. It will also how the maintainability and robustness of my program

Constraints

When it comes to my constraints for my project there are a few factors that apply for this project:

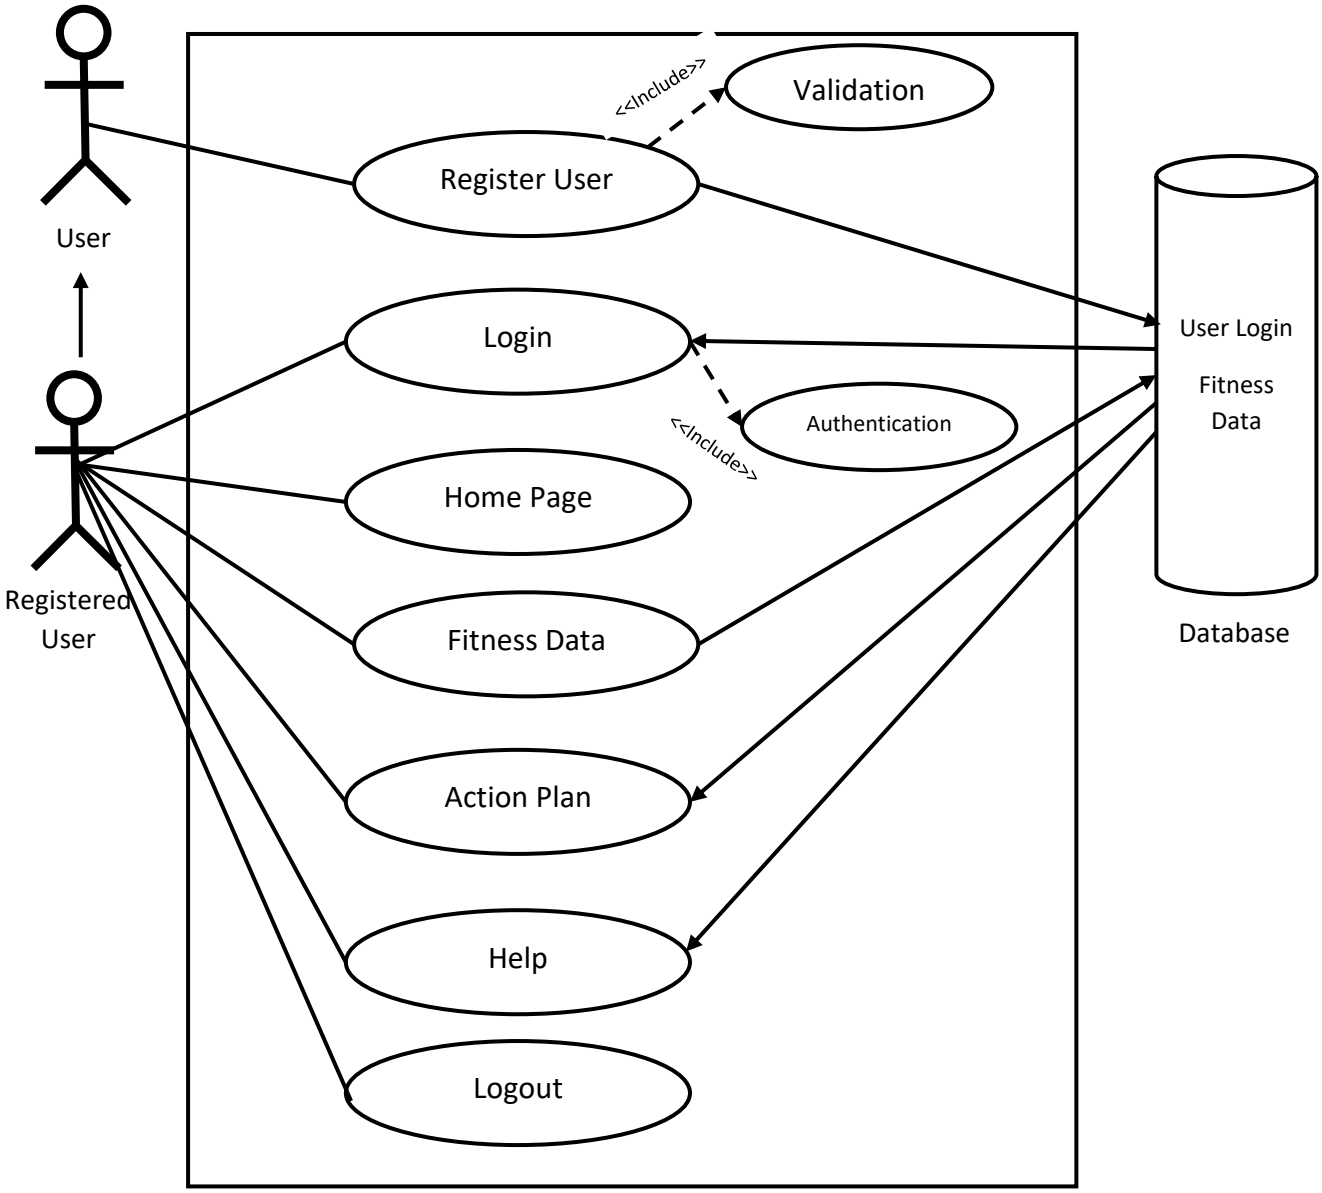
- My full completed project must be completed by the deadline of the 4th of March 2022.
- I ensure that I do not run into any copyright issues when it comes to the name of my project “YourFitnessFriend” and must to comply with the Copyright, Design and Patents Act 1988.
- I must ensure that there will be no costs involved during the course of my project as all of the software and materials are supplied by the school.
- I will be programming in Visual Basic within the Visual Studio 2010 software as I have several years of experience using this and I will be using EasyPHP as my Database Server while coding in MySQL as I believe it will be most suitable for my project.

Boundaries

The boundaries of my program will include:

- A login system which allow the end user to register a new username and password of their choice.
    - The username and password must contain more than 8 characters.
- The login system will use input validation, which will verify the credentials that the user has entered and allow them to be directed to the home page.
- When entering data users will not be able to:
    - Enter an Age less than 16, Weight less than 45kg or an Height less than 120cm
- The data will be calculated and stored within a Database to allow the fields to be stored externally rather than an array so it can be reused without re-entering.
- An insertion sort will be used to sort the fitness data, which will be displayed to the user.

UML: Use Case Diagram



Requirements Specification

For my program to be able to satisfy the requirements, it must meet several Criteria:

End User Requirements:

- The users for my system will be able to register a unique username and password of their choice.
- The user will be allowed to login using their own chosen username and password.
- The user will be able to easily navigate throughout my program.
- The user will be able to input their own fitness data into their program and be able to see their action plan.
- The user will also be able to access a help screen for tips to reach their desired goal.

Functional Requirements:

- My program will be able to store user credentials in an external database.
- My program will be able to validate all user inputs to make sure they are fit for purpose.
- My program will store the users data in an external database
- My program will display the user's action plan and a help screen.

Project Plan

Task	Sub Task	Duration	Start Date	Target Date
Analysis: **4 Hours And 30 Minutes** **(Over the course of 4 Days)**	Read AH Instructions for candidates and then generate my project idea	1 Hour	26th November	26th November
	Description of the problem: Outline of problem, Scope, Boundaries and Constraints	1 Hour 30 Minutes	3rd December	3rd December
	Create UML Use Case Diagram	45 Minutes	10th December	10th December
	Create Requirements Specifications for End User and Functional Requirements	45 Minutes	10th December	10th December
	Project Plan	30 Minutes	17th December	17th December
Design: **11 Hours And 15 Minutes** **(Over the course of 11 Days)**	Project Design - Pseudocode	4 Hour 30 Minutes	5th January	14th January
	User-interface Design – Wireframe	3 Hours	18th January	25st January
	Class Diagram	45 Minutes	26th January	26th January
	Design Data Dictionary	45 Minutes	28th January	28th January
	Design SQL	45 Minutes	28th January	28th January
Implementation: **8 Hours And 15 Minutes** **(Over the course of 9 Days)**	Create User Interface	3 Hours	1st February	8th February
	Create VB Program	3 Hour 45 Minutes	9th February	18th February
	Create Database	45 Minutes	9th February	9th February
	Write Description of new skills	45 Minutes	18th February	18th February
	Log of all ongoing testing	*Ongoing through implementation	1st February	18th February

Testing: **3 Hours And 45 Minutes** **(Over the course of 3 Days)**	Test Plan including Test Cases and Persona	1 Hour 30 Minutes	22th February	23rd February
	Implement Testing	1 Hour 30 Minutes	23rd February	25th February
	Report Testing Issues	45 Minutes	25th February	25th February
Evaluation: **1 Hours And 30 Minutes** **(Over the course of 2 Days)**	Write Project Evaluation	1 Hour 30 Minutes	1st March	2nd March
Finalise Project: **45 Minutes** **(Over the course of 1 Day)**	Finalise analysis Finalise design Finalise implementation Finalise testing and evaluation	45 Minutes	4th March	4th March
	Submit Project	----------	4th March	4th March

```

Database Design and Development SQL Code

Create Database:

```
CREATE DATABASE YourFitnessFriend;
```

Create UserLogin Table:

```
CREATE TABLE UserLogin (
userID int NOT NULL AUTO_INCREMENT,
UsernameData Varchar(20) NOT NULL,
PasswordData Varchar(20) NOT NULL
PRIMARY KEY(userID)
);
```

Create FitnessData Table:

```
CREATE TABLE FitnessData (
id int NOT NULL AUTO_INCREMENT,
userID int NOT NULL,
Gender Varchar(6) NOT NULL CHECK (Gender IN ("Male", "Female")),
Weight Int NOT NULL CHECK (Weight >=45),
Height Int NOT NULL CHECK (Height >=120),
Age Int NOT NULL CHECK (Height >=16),
Exercise Varchar(20) NOT NULL,
LoseOrGain Varchar(4) NOT NULL,
BMR Int NOT NULL,
ExerciseBMR Int NOT NULL,
FitnessGoal Int NOT NULL

PRIMARY KEY(id)
FOREIGN KEY REFERENCES UserLogin(UserID)
);
```

SQL Code from VB Program:

Login SQL:

```
("SELECT * FROM UserLogin WHERE UsernameData='" & EnterUsername.Text & "'
AND PasswordData='" & EnterPassword.Text & "'")
```

Register SQL:

```
("INSERT INTO UserLogin (UsernameData, PasswordData) VALUES('" & Username
& "','" & Password & "')")
```

Verify User SQL:

```
("SELECT UserId FROM UserLogin WHERE UsernameData ='" & UsernameEnter &
"'")
```

Insert Fitness Data SQL:

```
("INSERT INTO FitnessData(UserId, Gender, Weight, Height, Age, Exercise,
LoseOrGain, BMR, ExerciseBMR, FitnessGoal) VALUES('" & Newid & "','" &
Gender & "','" & Weight & "','" & Height & "','" & Age & "','" & Exercise
& "','" & LoseOrGain & "','" & BMR & "','" & ExerciseBMR & "','" &
FitnessGoal & "')")
```

Verify ID SQL:

```
("SELECT * FROM FitnessData, UserLogin WHERE FitnessData.userId =
UserLogin.userId AND FitnessData.userId = '" & EnterID.Text & "'")
```

Research and Development of New Skills and Knowledge

To create my project, I had to research skills that weren't taught as part of the Advanced Higher course. Here are a list of things I had to research:

VB User Interface:

I wanted the users of my program to have a great experience when using my program and wanted to have a successful UI design which contributes to a positive user experience as I feel my users will feel more comfortable while using my application. I wanted it to have a blue background as I felt like it has connotations of health and fitness. I did some research online and found that you can change the VB Forms BackColor in the properties section which allowed me to change the colours. So I implemented this by changing the background colour to be a light blue colour to differentiate my program so it didn't look generic.

VB PasswordChar:

I wanted to make sure my login system was secure so I had to make sure to hide the password field with asterisks for security purposes. I did some research online and found that you can enable UseSystemPasswordChar and set it to True as it will disable people to copy and paste the textbox. I then found out by adding an asterisks (*) in the PasswordChar field, it will replace whatever letter I typed with an asterisks. So when I type a letter it comes with asterisks.

UseSystemPasswordChar	True
PasswordChar	*

VB Add Icon to Button:

I wanted to make my buttons to look attractive so I wanted to add a style to it. I wanted to add icons as it can be a great way to bring essential content to the point. They are a great attention grabber and they will help the users of my program to find and scan content. I had to use royalty free icons online for my project to make sure I did not run into any Copyright infringements. So I went on to a website called Icon Scout to find some copyright free icons for my program.

VB Add Image:

I wanted to add in a logo into my program to ensure that it helps to establish credibility. I wanted it to be on every page except from the logout page. I did some research online and found that you can add images by adding in a PictureBox via the VB tool box. So then I added the logo onto each form except from by logout form.

On Going Testing

What I tested	How did I test it?	What happened?	Notes
Register Account	I entered a username and password greater than 8 characters and It showed an error.	Register account was not successful See Table Below	After Looking at Documentation I managed to get it working
Login Account	I entered the username and password I used to register an account	Login was successful and it directed me to the home page	N/A
Enter Fitness Data	I entered my fitness data but could not get my ID to display. But all of my data appeared in the database.	Entering Fitness Data See Table Below	After Looking at School Recourses and Documentation I managed to get it working and the ID was displayed to the user
Action Plan	I Entered the ID that the program gave to me but threw an error as the fields from the database were not assigning to the record structure	Viewing action plan not successful See Table Below	After Looking at Documentation I managed to get it working and then I could pass values from a database to a record variable
Insertion Sort	I tested this by seeing what is displayed. But I found that it would not sort through the fitness goal and would end up sorting the whole record.	Insertion Sort was successful but didn't sort through the fitness data See Table Below	Later I found that if you declare a temporary variable under the fitness record. It allows you to insert the data into the right order.
Help Page	I entered my ID and it worked as planned as before I fixed up all of the errors regarding declaring variables from database values and connection issues	Test was successful and the help page showed all of the details	N/A
Logout	I clicked the Logout button and pressed the tick	Logout was successful and directed me back to the Login page	N/A

Log of Ongoing Testing Errors

What I tested	Description of Issues	How I Resolved	References
Login System	When I tried to register my login details by using an INSERT statement. It had many errors saying that I could not establish a connection and my data did not enter any table.	I looked up VB documentation on database connection to resolve my issue and get it working.	• https://docs.microsoft.com/en-us/troubleshoot/developer/dotnet/framework/general/open-database-by-sql-server-dotnet-data-provider
SQL Connection + UserID	When I tried to insert my fitness data into my database there was more connection issues that were different to the one previous. I also had to find a way on how to give the UserID to the user after the entered their username.	I had to use multiple SQL statements and connections to allow this to work.	• https://docs.microsoft.com/en-us/troubleshoot/developer/dotnet/framework/general/open-database-by-sql-server-dotnet-data-provider • School Resources and Notes
Reading Data From Database into a Record	When I tried to read the database from the table and select the Fitness Goal and declare it into a record. I ran into many errors regarding passing value from database to a variable.	I had to look up a source on how to do this and implement it.	• https://www.daniweb.com/programming/software-development/threads/388157/passing-value-from-database-to-a-variable

Using an Insertion Sort for an Array of Records	I tried to sort the fitness goals from the fitness data by using an insertion sort algorithm. But I could not find a way on how to sort through an array of records.	I found that if you declare a temporary variable under the fitness record. It allows you to insert the data into the right order.	• N/A
VB Rnd Function	I wanted to give the users of my program a random meal plan depending on their fitness goal. So I wanted to generate a number between 1 and 5. I used the Rnd function but I found that It would display the same number over and over again.	I looked up VB documentation on generating random variables to resolve my issue and get it working so that it generates a different number each time.	• https://docs.microsoft.com/en-us/office/vba/language/reference/user-interface-help/rnd-function

Testing the Solution

Final Test Plan

Persona

My Persona for my program is someone who wants to improve their fitness. They will be an 18 year old male who is in university studying Computing Science and has a part time job at a Tech Start Up so he is very experienced and has no problem navigating around systems. He is around 60kg, 167cm tall and does exercise 3 to 5 times a week. He will be able to register a unique username and password of their choice greater than 8 characters. He will also be able to login with their chosen username and password. He will also be able to easily navigate around my program. He will then be able to enter his fitness data and read his action plan created for him. On top of this, he will be able to view a help page that will help to him reach his desired goal. He has no issues with accessibility and can easily use a keyboard and mouse.

In return the program should be able to store his credentials onto a database, validate all of his inputs to make sure it's all fit for purpose. The program will be able to store all of the user's fitness data onto an external database and finally display an action plan for the user and a help screen. The program should be able to sort through all of the fitness data using the Insertion Sort Algorithm.

For this test the persona will be doing Integrative Testing and will be testing the whole programs performance together. So all of the components of my program will be tested together to see if all systems work with each other.

Test Table

Test Requirements	Description	Test Case	Type of Testing	Expected Output
Register Account	Create New Account	Click on register and register an account Username & password must be greater than 8 characters After registering an account click home	Normal: Greater than 8 characters Exceptional: Letters, symbols and numbers and less than 8 characters Extreme: Equal to 8 characters	Normal: Account will be created and will show message Exceptional: Account will not be created Extreme: Account will be created and will show message
Login Account	Login into New Account	Login using your account details that you used previously	Normal: Exact Details Exceptional: Wrong Details Extreme: Different Capitalisation	Normal: Login will be successful and will direct you to the home page Exceptional: Login will not be successful Extreme: Login will not be successful

Enter Fitness Data	Enter Username and Calculate Fitness data by Entering Biometric Data. Program will display ID	Enter your username and Enter your data for the program to calculate your fitness goal. Make sure you use your account details that you used previously Age must be greater than or equal to 16 Weight must be greater than or equal to 45 Height must be greater than or equal to 120 After Entering Data Click Home	Normal: Age is greater than 16 Weight is greater than 45 Height is greater than 120 Exceptional: Letters, symbols and numbers and less than 16, 45, 120 Extreme: Equal to 16, 45, 120	Normal: Entering details will be successful and will display a message. The program will display your ID. Exceptional: Entering details will not be successful and will display an error. The Program will not display your ID. Extreme: Entering details will be successful and will display a message. The program will display your ID.

Action Plan	View Action Plan with ID	Enter your ID into the program to view your action plan. Make sure you use your ID that was shown previously After viewing Action Plan click Home	Normal: ID that was assigned to user Exceptional: Letters and Symbols Extreme: Blank	Normal: Showing action plan will be successful and will display a message saying that data has been sorted. Exceptional: Showing action plan will not be successful and will not display message saying that data has been sorted Extreme: Showing action plan will not be successful and will not display message saying that data has been sorted
Help	View Help Page with ID	Enter your ID into the program to view your action plan. Make sure you use your ID that was shown previously. After viewing Help Page click Home	Normal: ID that was assigned to user Exceptional: Letters and Symbols Extreme: Blank	Normal: Showing Help will be successful Exceptional: Showing Help will not be successful Extreme: Showing Help will not be successful
Logout	Click Logout to Exit to the Login Page	On the home page. Click Logout. Click the tick to Logout	Normal: Click the tick to Logout Click the cross to Cancel Exceptional: N/A Extreme: N/A	Logout will be a success and will direct you to the Welcome Page (Login Page) Or Will take you back to the Home Page

Help (Extreme)	Help Page is partly shown. How to Lose / Gain Weight is not shown
Logout	
Logout (Normal) [TICK]	Logout successful and user is directed to Login Page
Logout (Normal) [CROSS]	Logout is not successful and user is directed to Home page

Evaluation of the solution

Fitness for Purpose

After testing my project I now know and confirm that my project meets all of the end user and functional requirements.

The results of my testing show that users are able to register a unique username and password of their choice greater than 8 characters, login with their chosen username and password, navigate around my program, enter their fitness data, read their action plan created for them and will also be able to view a help page that will help to reach their desired goal. After testing, it showed that my program can store the user's login details and fitness data in an external database.

All inputs have been validated to ensure they are fit for purpose and match my requirements. The program will also display the action plan and help page.

My program successfully makes use of the AH concepts we learned in class: The Insertion Sort Algorithm and an Array of Objects. It reads the fitness data from the database and sorts them in order and displays the correct Fitness Goal. The Class was called in an external script and was implemented throughout the program. Throughout testing it showed that both the sort algorithm and the class worked and met the requirements.

My program does the integration of the SQL database effectively for my implementation. The connection string was created and the data was inserted and read effectively each time and stored all of my data while giving each row a unique identifier by using auto increment.

After testing with the test cases it showed that my persona was able to successfully complete all tasks given to them. I also managed to complete all of the tests in my test plan and then show evidence for each of the tests. I am confident that my project meets all of the requirements listed in the end user and functional requirements.

Requirements Check List

End User Requirements:	**Completed**
The users for my system will be able to register a unique username and password of their choice.	✓
The user will be allowed to login using their own chosen username and password.	✓
The user will be able to easily navigate throughout my program.	✓
The user will be able to input their own fitness data into their program and be able to see their action plan	✓
The user will also be able to access a help screen for tips to reach their desired goal	✓
Functional Requirements:	
My program will be able to store user credentials in an external database.	✓
My program will be able to validate all user inputs to make sure they are fit for purpose.	✓
My program will store the users data in an external database	✓
My program will display the user's action plan and help page.	✓

Maintainability

I believe that my solution is maintainable. I have used meaningful variable names for all of my VB class and record structures and also for the SQL database fields. This allows for Improved Code integration, clarity and consistency. Making meaningful distinctions in my code allows me to identify what each variable does. Here is a screenshot showing some of the variables names I used in my VB Class.

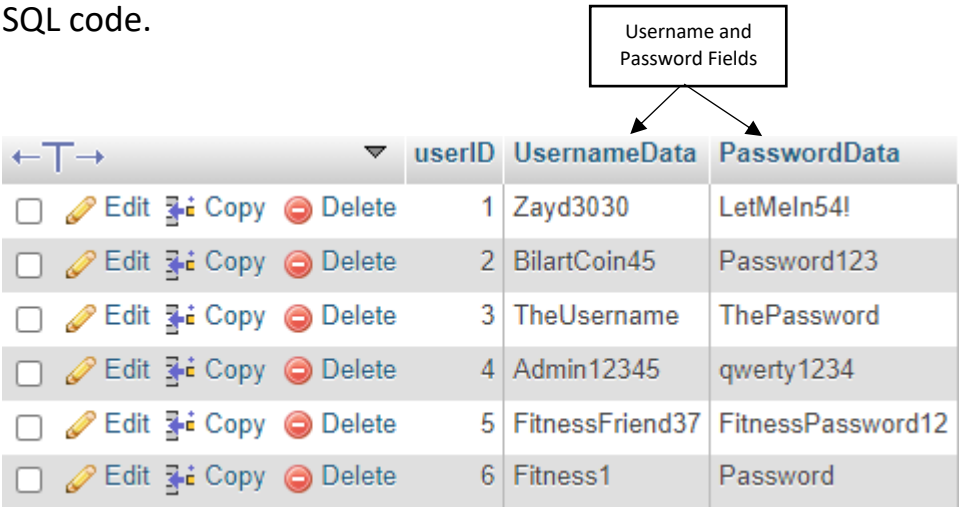
```
Public Class FitnessData
    Public id As Integer
    Public Gender As String
    Public Weight As Integer
    Public Height As Integer
    Public Age As Integer
    Public Exercise As String
    Public LoseOrGain As String
    Public BMR As Integer
    Public ExerciseBMR As Integer
    Public FitnessGoal As Integer
```

For example:

The variable name BMR is distinguishable from ExerciseBMR

BMR relates to the raw BMR which has been calculated for the user. The ExerciseBMR relates to the updated BMR after how much exercise the user has done is been accounted for. Another example is LoseOrGain. Which clearly represents what the main goal for the user if they want to either lose or gain weight. Having distinguishable names allows me to recognise and identify different sections of my code. Since it's held in a class this also means that I can reuse my code for other future developments or updates required, it will be easier as it has held strong maintenance.

Here is a screenshot showing some of the database field's names I used in my SQL code.



I made sure to use the names UsernameData and PasswordData to ensure I did not run into any errors in my program code as having a field name "Password" will have its own authentication and will flag up an error.

I also used a lot of white space in my code into split the code into several sections and I have also called in sub procedures so that my code is clean and can perform the right procedures.

Here is a section of my code which shows all of that.

```
Public Class Form6
    Private Sub BtnHome_Click(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles BtnHome.Click
        LstDisplayGoal.Items.Clear()
        LstDisplayAS.Items.Clear()
        LstDisplayDP.Items.Clear()
        EnterID.Clear()
        Me.Hide()
        Form3.Show()
    End Sub

    Private Sub BtnLoad_Click(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles BtnLoad.Click
        Dim fitness As Fitness
        Dim connection As MySqlConnection
        Dim command As MySqlCommand
        Dim connectionString As String = "server=localhost;user=root;password=;database=YourFitnessFriend"
        Dim reader As MySqlDataReader
        Dim myRnd As Integer
        Dim days As Integer

        connection = New MySqlConnection(connectionString)
        connection.Open()

        command = New MySqlCommand("SELECT * FROM FitnessData, UserLogin WHERE FitnessData.userId = UserLogin.userId AND FitnessData.userId = '" & EnterID.Text & "'")
        command.Connection = connection
        reader = command.ExecuteReader

        While reader.Read()
            fitness.FitnessGoal = reader.Item("FitnessGoal")
            Call InsertionSort()
            LstDisplayGoal.Items.Add("Your Fitness Goal is " & fitness.FitnessGoal & " Calories ")

            fitness.Exercise = reader.Item("Exercise")

            If fitness.Exercise = "Sedentary" Then
                days = 3
            ElseIf fitness.Exercise = "Lightly" Then
                days = 3
            ElseIf fitness.Exercise = "Moderately" Then
                days = 4
            ElseIf fitness.Exercise = "VeryActive" Then
                days = 5
            ElseIf fitness.Exercise = "ExtraActive" Then
                days = 6
            End If
```

Multiple Sub Routines

Calls in Insertion Sort Sub routine

White Space to separate code into sections for readability

Robustness

All of my inputs for my program are robust as every input is validated to ensure the user encounters no errors when using my program. When registering an account I implemented this code to ensure that the username and password is greater than 8 characters, is not under 8 characters and is not left blank.

```
connection.Open()
If Len(Username) >= 8 Or Len(Password) >= 8 Then
    command.ExecuteNonQuery()
    MsgBox("Account Created")
    Me.Hide()
    Form1.Show()
ElseIf Username <> "" Or Password <> "" Then
    MsgBox("Error - Please Enter a Username and Password Greater Than 8 Characters")
ElseIf Username = "" Or Password = "" Then
    MsgBox("Error - Please Enter a Username and Password")
End If
connection.Close()
```

Also when logging into an account I implemented this code to ensure that the username and password is converted to a string to make sure I do not encounter any errors and made sure it matched the username and password entered into the text box matched the one in the database.

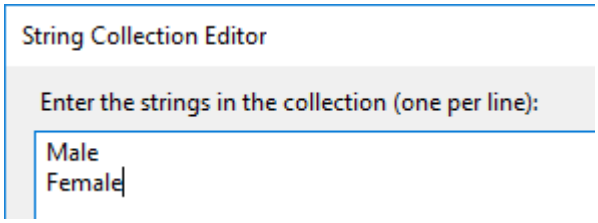
```
While reader.Read()
    Dim GetUsername As String = reader.GetString(1).ToString
    Dim GetPassword As String = reader.GetString(2).ToString

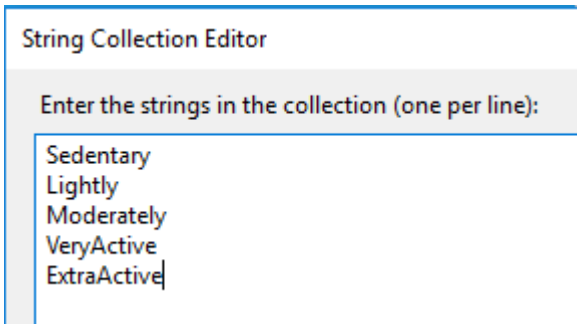
    If GetUsername = EnterUsername.Text And GetPassword = EnterPassword.Text Then
        MsgBox("Login Successful")
        EnterUsername.Clear()
        EnterPassword.Clear()
        Me.Hide()
        Form3.Show()
    ElseIf GetUsername <> EnterUsername.Text And GetPassword <> EnterPassword.Text Then
        MsgBox("Login Failed")
    End If

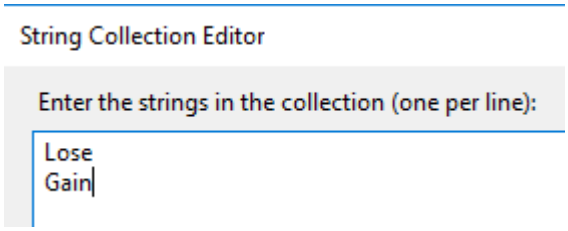
End While
```

When entering data I wanted to ensure that my program maintained robustness so I added input validation to every input. I added combo boxes to reduce the user's choice to make sure they are no errors and showed error messages to tell the user if they don't meet the requirement.

```
If Person1.Weight < 45 Then
    MsgBox("Error - Please Enter a Weight Over 45 KG")
ElseIf Person1.Height < 120 Then
    MsgBox("Error - Please Enter a Height Over 120 CM")
ElseIf Person1.Age < 16 Then
    MsgBox("Error - Please Enter an Age Over 16")
Else
    command.ExecuteNonQuery()
    MsgBox("Data Added")
    MsgBox("Your ID is " & Newid)
```







Final Evaluation

I am very confident that my implemented project matches my design and requirements as shown from my Testing and Evaluation. I have made sure that my full completed project was completed by the deadline of the 4th of March 2022. I believe, I have not run into any copyright issues by using royalty free icons and creating my logo on a free logo making website. Also, when it came to the name of my project “YourFitnessFriend”, I had to comply with the Copyright, Design and Patents Act 1988 so it wasn’t similar to “MyFitnessPal” by Under Armour. I made sure that there was no costs involved during the course of my project as all of the software and materials are supplied my school. I made sure to do my programming with the Visual Basic Language within the Visual Studio 2010 software as I have several years of experience using this and used EasyPHP as my Database Server while coding in MySQL. As I believe that this was most suitable for my project. Therefore I am confident that my project matches the design and requirements as shown by my evaluation of my project.
